2: uniprot_trembl:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C.-Innked sialic acid. The sialic acid recognition site may be
```

masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via their SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules.

SUBUNIT: Interacts with PTPN6/SHP-1 upon phosphorylation.
SUBCELLULAR LOCATION: Type I membrane protein (isoforms 1-4);
secreted (isoform 5).

-!- TISSUB SPECIFICITY: Expressed by macrophages in various tissues including Kupffer cells. Also found in brain microglia.
-!- DOMAIN: Contains I copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated ITIM motif can bind the SH2 domain of several SH2-
                                                                                                                                    "Cloning and characterization of human Siglec-11. A recently evolved signaling that can interact with SHP-1 and SHP-2 and is expressed by tissue macrophages, including brain microglia."; J. Biol. Chem. 277:24466-24474(202).

Nature 428:529-535(2004)
```

-i- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Binds equally to alpha2,3-linked and alpha2,6-linked sialic acid. The sialic acid recognition site may be masked by dis interactions with sialic acids on the same cell surface.

-!- SUBCELULIAR LOCATION: Type I membrane protein.
-!- SUBCELULIAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Expressed by monocytic/myeloid lineage cells. Found at high levels in professed blood leukocytes, spleen, bone marrow and at lower levels in lymph node, lung, appendix, placenta, pancreas and thymus. Expressed by monocytes and neutrophils but absent from leukemic cell lines representing early stages of myelomonocytic differenciation.
-!- DOMAIN: Contains 1 copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated ITIM motif can bind the SH2 domain of several SH2-

containing phosphatases.
--- SIMILARITY: Belongs to the immunoglobulin superfamily. SIGLEC (stallt acid binding Ig-like lectin) family.
--- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
--- SIMILARITY: Contains 1 immunoglobulin-like V-type domain.

PUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,3-linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. SUBCELBULAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: Predominantly expressed by immature monocytic/myeloid lineage cells in bone marrow. Also found at lower levels in mature neutrophils and monocytes.

DOMAIN: Contains I copy of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This

The phosphorylated ITIM motif can bind the SH2 domain of several SH2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     containing phosphatases.
SIMILARITY: Belongs to the immunoglobulin superfamily. SIGLEC (siallic acid binding 1g-like lectin) family.
SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mus muscullus (Mouse).

Submitted (OCT 2000) to the EMBL/GenBank/DDBJ databases.

-I. FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to adha2,3-linked sialic acid. Also binds to alpha2,6-linked sialic acid. Also binds to alpha2,6-linked sialic acid. Submitted to a site may be masked by cis interactions with sialic acids on the same cell surface.

-I. SUBCELLULAR LOCATION: Type I membrane protein.

phosphorylated ITIM motif can bind the SH2 domain of several SH2-containing phosphatases.
SIMILARITY: Belongs to the immunoglobulin superfamily. SIGLEC (sialic acid binding Ig-like lectin) family.
SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Interprise small intestine and darenal gland; it is lower expressed in thyroid, beast. The long isoform is highly expressed in spleen, small intestine and bone marrow; it is lower expressed in thyroid, brain and testis.
                                                                                                                                                                                                                                                                             DOMAIN: Contains 1 copy of a cytoplasmic motif that is referred to
as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This
motif is involved in modulation of cellular responses. The
phosphorylated ITIM motif can bind the SH2 domain of several SH2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sialic acid binding Ig-like lectin-like
                                                                                                                                                                                                                                                                                                                                                                                 Containing phosphatases.
SIMILARITY: Belongs to the immunoglobulin superfamily. SIGLEC (similar card binding Ig-like lectin) family.
SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 2 immunoglobulin-like V-type domains.

                                                                                                                                     -1- SUBCELLULAR LOCATION: Type I membrane protein.
-1- DOMAIN: Contains I copy of a cytoplasmic motif (ITIM). This as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in modulation of cellular responses. The phosphorylated ITIM motif can bind the SH2 domain of several SH2-containing phosphases to the immunoglobulin superfamily. SIGLEC (stails and binding 1g-like lectin) family. SIGLEC (stails can binding 1g-like lectin) family. SIGLEC (SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7 LSSLLGGSQAMDGRFWIRVQESVMVPEGLCISVPCSFSYPRQDWTGSTPAYGYWFKAVTE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Potential.
Sialic acid binding Ig-like lectin-like
Mod. Chem. 276:40282-40287(2001).
FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   InterPro; IPR07110; Ig-like.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1, A

t 0 - useful New sialoadhesin family 4 polypetides and polynucleotides treat various diseases associated with SAF-4 expression.

Claim 1; Page 31; 48pp; English.

This is the amino acid sequence of new human sialoadhesin family 4 (SAF-4), as deduced from the nucleotide sequence of an isolated cDNA clone (see AAV99911). SAF-4 polynucleotides and polypeptides, and methods for producing such polypeptides in transformed host cells using recombinant techniques are disclosed. SAF-4, its agonists and antagonists, and nucleat acid molecules that enhance or inhibit SAF-4 expression, may be used to treat patients in need of enhancement or inhibition of SAF-4

expression or activity. Conditions that may benefit from such treatment include cancer, inflammation, autoimmunity, allergy, astina, rheumatoid arthritis, CNS inflammation, cerebellar degeneration, Alzheimar, adisease, Parkinson's disease, multiple sclerosis, amyotrophic lateral solerosis, head injury damage and other neurological disorders, septic shock, sepsis, stroke, osteoporosis, osteoarthritis, ischemic injury, cardiovascular disease, kidney disease, liver disease, ischemic injury, wocardial infarction, hypotension, hypertension, ADS, myelodysplastic syndromes and other heamatologic abnormalities, aplastic anaemia, male baldness pattern and bacterial, protozoal, fungal and viral infections related to SAF-4 polypeptide activity. Methods of identifying agonists, anatagonists/inhibitors are also provided, as well as diagnostic assays for detecting diseases associated with inappropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                SAF-4 activity or levels

This sequence is a human obesity protein binding protein-2 homologue (hobbensed) of the invention. The hoB-BP2h nucleic acids and polypeptides may be used for the manufacture of a medicament for the treatment of obesity and/or obesity-related disorders. The hoB-BP2h nucleic acids are useful as probes or amplification primers in the detection, quantification or isolation of gene sequences or transcripts, for recombinant expression of hoB-BP2h polypeptides, as immunogens in the preparation and screening of antibodies, and in sense or antisense suppression of one or more hoB-BP2h genes or nucleic acids, host cell or tissue in vivo or in vitro. Antigenic epitope-bearing peptides and oplypeptides are useful for raising of accepting that specifically binds to the hoB-BP2h
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA80606-A80653 encode the 12 secreted protein sequences given in AAB505676-B25593. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; anti-inflammatory; antiarthritic; antirhumatic, dermanological; antiproliferative; antiarteriosclerotic; anticancer; vulnerary; antivixal; antibacterial; and antifungal activity. The proteins, polypeptides, agonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases.
                                                                                                                     540

antagonists may be used to treat prevent and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid arthritis, dermatitis, and multiple sclerosis; inflammatory disorders e.g. inflammatory bowel disease, Crohn's disease and nephritis; hyperproliferative disorders such as paraptroleniamemias and purpura; cardiovascular disorders e.g. coronary arteriosclerosis and myocarditis, cancer e.g. melanoma and lymphoma. The proteins and polymucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene #5 and protein sequences are represented in sequences AAA80610 and AAB25580. Sequences AAA80649 represent genes related to the

New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting disorders.

Claim 11; Fig 13; 454pp; English.

The invention relates to an isolated mucleic molecule that is at least 55% identical to 18 human cDNA sequences representing 12 novel genes CC go encoding secreted proteins or a polymucleotide fragment of the cDNA sequence contained in American Type Culture Collection (ATCC) deposit No. defined in the specification, its species homologue, a variant or allelic sequence contained in American Type Culture Collection for allelic contained in the polymucleotide having a polymucleotide where the polymucleotide having a polymucleotide where the polymucleotide for the polymolations to a nucleic acid molecule comprising a nucleotide sequence of only A or T residues. Also included are recombinant vectors, host cells (for producing the polympetide), the secreted polymeptide (comprising a sequence that is at least 55% identical to a polympetide (comprising a sequence that is at least 55% identical to a polympetide fragment, domain, epitope, full-inaith to protein, variant, allelic variant or species homologue), antibodies that specifically bind to the polympetides, diagnosing, treating, preventing or ameliorating a medical condition by administering the polymucleotide cortivity or a condition protein condition, and detecting an activity in a biological assay (by expressing the cDNA sequence and identifying the protein in the supermatant or a biological assay and identifying the protein or a susceptibility to a condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation are also useful for chemistry assays. The polympetides are also useful for central protein and antibodies are useful for trestri

The invention relates to an isolated SIGLEC (sialic acid-binding Igrelated lectin) protein (I). Pharmaceutical compositions comprising (I) are useful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases. Extracellular domains of (I) represent potential markers for screening, diagnosis, prognosis, follow up assays, and imaging methods. (I) is useful as a target for drugs which inflammation, tissue damage and remodeling in asthma, and inflammation, tissue damage and remodeling in asthma, and inflammation to salege such as allergic rhinitis, osteoarthritis, crohn's disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleotis methods, and to detect the presence are useful for screening genomic library to isolate a genomic clone of signases or disorders associated with SIGLEC-BMS transcripts or proteins. The SIGLEC-BMS antibodies are also used to detect, sort or isolate cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid sequence, or its allelic variant, a fragment of the CDNA sequence, or its fragment, domain, epitope or species homologue. The nucleic acid is useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver discorders such as hepatitis or neural discorders such as Alzheimer's disease. The present sequence represents the amino acid sequence of a novel human secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

The invention relates to an isolated mucleic molecule that is at least CC 95% identical to 18 human cDNA sequences representing 12 novel genes concoding secreted proteins or a polyvucteotide fragment of the cDNA.

C defined in the specification, its species homologue, a variant or allelic variant of the polymucleotide having a polymucleotide capable of the polymucleotide having a polymucleotide capable of the polymucleotide having a polymucleotide capable of the polymucleotide sequence of only A or T residues. Also included are cereted polypeptide sequence of only A or T residues, 15% included are recombinant vectors, host cells (for producing the polypeptide), the crecombinant vectors, host cells (for producing the polypeptide) the protein, variant, allelic variant or species homologue), antibodies that serviced protein, variant, allelic variant or species homologue), antibodies that specifically bind to the polypeptides, diagnosing, treating, preventing or ampliorating a medical condition by administering the polymucleotide contribution by administering the polymucleotide is equence in a cell, isolating the supernatant, and detecting an activity or in a biological condition, for preventing, treating, or amplibodies are useful for diagnosing a pathological condition or a susceptibility to a pathological condition, such as cancer, inflammation and other immune disorders, neurological and bloopical condition or a susceptibility to a pathological condition, for preventing, treating, or amplicating a condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation or association of the providing immunological probes for differential identification of chromosome identification, radiation which mapping or long-range conditions are negletically probes for differential identification of chromosome identification, radia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting

The present invention describes human cell surface protein with changed designated 856-19 (i). (i) has cytocatatic, dynacological, immunosuppressive, antiinflammatory, antiasthmatic, antidiabetic and darmatological activities, and can be used in gene therapy. (I) can be used for preventing treating or ameliorating and can be used for preventing treating or ameliorating and can be used for preventing treating or ameliorating and can be used in garder related to aberrant immunoglobulin receptor activity, adsorder; a disorder call turface receptor activity; a callular adhesion disorder; a disorder callular and treating or ameliorating and sorder callular and treating and adsorder; and ovarian disorder; and sorder callular and treating and and adsorder; and ovarian disorder; ovarian cancer; dysfunction; infertility; pelyic inflammatory disease; candometriosis; placental aromatase deficiency; because for placental dysfunction; infertility; pelyic inflammatory disease; candometriosis; placental characteristics; aberrant showing of female primary sexual characteristics; aberrant showing of conference addressed conference puberty; precocious puberty; precocious puberty; precocious puberty; precocious precocious precocious; premature thelarche; premature puberty; precocious puberty; precocious aberrant ovarian cycle; memorrhagia; merorrhagia; menometorrhagia; menometorrhagia; merorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; merorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; menometorrhagia; pesitatatic-ovaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 FKAVTETTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV 120

in the formation, differentiation and maintenance of multicellular corganisms. The fate of many individual cells (for example proliferation, or organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information. Treceived from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, auryival factors, cytocoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse neuropeptides and hormones) which are received and interpreted by diverse call receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. These membrane bound proteins are the interpreted by diverse and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic actids of the invention may be useful for the manufacture of a medicament for diagnosing or treating etumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to PRO proteins and their coding sequences.

The PRO proteins are useful for diagnosing and treating a B cell related disorder, e.g. X-linked infantile hypogammaglobulinemia, polyaacdaride antigen unresponsiveness, selective IgA deficiency, selective IgH deficiency, selective IgA deficiency, selective IgH deficiency with hypogammaglobulinemia of infancy, Burkit's Important hypogammaglobulinemia of infancy, Burkit's Important hypogammaglobulinemia of infancy, Burkit's Important hypogammaglobulinemia of infancy, Burkit's Important hypogammaglobulinemia of infancy, Burkit's Important hypogammaglobulinemia of infancy, Burkit's Important hypogammaglobulinemia of infancy Burkit's Important in hyposacticism, glomerulonephritis, or ansemia, myasthenia gravis, hypoadrencorticism, glomerulonephritis, or anxionament for treating a condition that is responsive to the PRO protein, e.g. cancer or immune-mediated inflammatory diseases. The PRO coding sequences are useful as hybridization probes in chromosome and gene mapping, in preparing PRO proteins, or in generating transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents.
New PRO polypeptide, useful for diagnosing and treating a B cell related disorder, e.g. Burkitt's lymphoma, rheumatoid arthritis, autoimmune mediated hemolytic anemia, myasthenia gravis or ankylosing spondylitis.
                                                                                                                                                                                                                                                                                Immunosuppressive, Cytostatic, Antiarthritic, Antirheumatic, Antianemic, Antianeric, Antianeric, Antianeric, Antianeric, Muscular, Neuroprotective, Nephrotropic, Antiinflammatory, Gene Therapy, PRO, B cell related disorder, cancer; immune-mediated inflammatory disease, human.

WPI; 2002-241565/29. N-PSDB; ABK43361 Novel isolated SIGLEC (sialic acid-binding Ig-related lectin) protein molecules useful for treating immune system diseases such as asthma, leukemia, allergic rhinitis, psoriasis, conjunctivitis, Crohn's disease.

Claim 5; Fig 3B; 209pp; English.

related lectin) protein (31). Pharmaceutical compositions comprising (1) are useful for treating immune system diseases such as asthma, leukaemia or other allegic or inflammatory diseases such as asthma, leukaemia or other allegic or inflammatory diseases. Extracellular domains of (1) represent potential markers for screening, diagnosis, prognosis, follow up assays, and imaging methods. (1) is useful as a target for drugs which inflammatory diseases such as allergic rhinitis, osteoarthritis, Crohn's disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (1) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (11) encoding (1) are useful in diagnosis and/or prognosis methods, and to detect the presence useful in diagnosis and/or broughous (11) are useful as nucleic acid probes proteins in a biological sample. (11) are useful as nucleic acid probes are useful for screening genomic library to isolate a genomic clone of SIGLEC gene. SIGLEC-BMS gene copy number is determined for detecting diseases or disorders associated with SIGLEC-BMS transcripts or proteins. The SIGLEC-BMS antiodies are also used to detect, sont or isolate estimated semined semined for detecting diseases or disorders associated with SIGLEC-BMS transcripts or proteins. The SIGLEC-BMS antiodies are also used to detect, sont or isolate estimated expressing signated-BMS proteins and in diagnostic imaging technology.

WPI: 2003-533050/50. N-PSDB; ADD19239 New isolated nucleic acids encoding signal transduction pathway component polypeptides, useful for diagnosing, treating, and/or preventing disorders, such as cancer, infections, cardiovascular and inflammatory diseases

Claim 11; SEQ ID NO 141; 554pp; English

The invention relates to an isolated nucleic acid molecule (CDNA)

concoding a human secreted protein, representing one of 85 novel genes.

Also included are recombinant vectors, host cells (expressing the protein), the secreted proteins (including their fragments, epitopes and homologues), an isolated antibody that binds specifically to the protein, diagnosing a pathological condition or susceptibility to a pathological condition (comprising determining the presence or absence of a mutation in the nucleic acid and diagnosing a condition based on the presence or absence or a susceptibility to a pathological condition (comprising determining the protein in a biological condition or susceptibility to a pathological condition (comprising determining the presence or amount of expression of the protein in a biological sample or and angenosing a condition based on the presence or amount of expression of the protein in a biological condition by administering the nucleic acid or protein to a mammalian subject, by administering the nucleic acid or protein, the gene corresponding to the cDNA sequence, and identifying an activity in a biological assay (comprising expressing the nucleic acid in a cell, isolating the

supernatant, detecting an activity in a biological assay and identifying the protein in the supernatant having the activity). The nucleic acids and proteins display the following activities Cytostatic, antibacterial, Virucide, Neuroprotective, Gynaecological, Gastrointestinal-Gen, Cardiant, Cardiavascular-Gen, Nephrotropic, Antinflammatory, Muscular-Gen, Respiratory Cen, Immunosuppressive, Carebroprotective, Vasotropic, Nootropic, Antialiergic. The methods and compositions of the present invention are useful for diagnoshing, treating, preventing and/or prognosticating disorders related to the novel polypeptides, such as cancer, bacterial or viral infections, and neural, immune system, blood, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, remal, inflammatory or proliferative disorders (many examples of these diseases and disorders are given in the specification). The present sequence represents a novel secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88

The invention relates to an isolated SIGLEC (sialic acid-binding Igrelated lectin) protein (I). Pharmaceutical compositions comprising (I) are unseful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases such as asthma, leukaemia or other allergic or inflammatory diseases. Extracellular domains of (I) represent potential markers for screening, diagnosis, prognosis, following passays, and imaging methods. (I) is useful as a traget for drugs which inhibit inflammation, tissue damage and remodeling in asthma, and inflammatory diseases such as allergic rhinitis, osteoarthritis, Crohn's disease, psoriasis, rheumatorid arthritis, conjunctivitis, erc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity or SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleotide sequences and/or SIGLEC-BMS proteins in a biological sample. (II) are useful as nucleic acid probes proteins in a biological sample. (II) are useful as nucleic acid probes diseases or disorders associated with SIGLEC-BMS transcripts or proteins. The SIGLEC-BMS antibodies are also used to detect, sort or isolate cells expressing SIGLEC-BMS proteins and in diagnostic imaging technology.

ANUBLOTA-ANUBROSS represent human SIGLEC amino acid sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ERGSYVRYNFMNDGFFLKVTVLSFTPRPQDHNTDLTCHVDFSRKGVSAQRTVRLRVAYAP 180

The present invention describes secreted and transmembrane polypeptides and their polymucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ3381 to AAZ34338, and AAX41685 to AAX41774 represent polymucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FKAVTETTKGAPVATNHOSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV 120

AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bicactive molecules to cells and for modulating biclogical activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide provide specific targeting of bicactive molecules to cells. AAC786700 to AAC78887 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel PRO polypeptides and polynucleotides used in detection methods, target bioactive molecules to specific cells, and to modulate cellular

t C New sialoadhesin family 4 polypetides and polynucleotides - useful treat various diseases associated with SAF-4 expression.

Claim 1; Page 31; 48pp; English.

This is the amino acid sequence of new human sialoadhesin family 4 (SAF-4), as deduced from the nucleotide sequence of an isolated cDNA clone (see AAV99911). SAF-4 polynucleotides and polypeptides, and methods for producing such polypeptides in transformed host cells using recombinant techniques are disclosed. SAF-4, its agonists and antagonists, and nucleic acid molecules that enhance or inhibit SAF-4 expression, may be used to treat patients in need of enhancement or inhibition of SAF-4

ି ଅନୁକ୍ତ Blank (uspto)

```
include cancer, inflammation, autoimmunity, allergy, asthma, treatment arthritis, CNS inflammation, cerebellar degeneration, Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, head injury damage and other neurological disorders, septic shock, sepsis, stroke, osteoporosis, osteoarthritis, ischemia reperfusion injury, cardiovascular disease, Midney disease, liver disease, ischemic injury, myocardial infarction, hypotension, hypertension, AlDS, myelodysphastic syndromes and other haematologic abnormalities, aplastic infections related to SAF-4 polypeptide activity. Methods of identifying agonists, antagonists, inhibitors are also provided, as well as diagnostic assays for detecting diseases associated with inappropriate SAF-4 activity or levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             540

AAY97543;

This sequence is a human obesity protein binding protein-2 homologue (hobbensh) of the invention. The hOB-BP2h nucleic acids and polypeptides may be used for the manufacture of a medicament for the treatment of obesity and/or obesity-related disorders. The hOB-BP2h nucleic acids are useful as probes or amplification primers in the detection, quantification or isolation of gene sequences or transcripts, for recombinant expression of hOB-BP2h polypeptides, as immunogens in the preparation and screening of antibodies, and in sense or antisense suppression of one or more hOB-BP2h antibodies, and in sense or antisense suppression of one or more hOB-BP2h antigenic epitope-bearing peptides and polypeptides are useful for raising or screening antibodies that specifically binds to the hOB-BP2h 241 HPWGPRPLGLELPGVKAGDSGRYTCRAENRLGSQQRALDLSVQYPPENLRVMVSQANRTV 300 420 BRGSYVRYNFMNDGFFLKVTVLSFTPRPQDHNTDLTCHVDFSRKGVSAQRTVRLRVAYAP FKAVTETTKGAPVATNHQSREVEMSTRGRFQLTGDPAKGNCSLVIRDAQMQDESQYFFRV Human obesity protein binding protein-2 homologue; hOB-BP2h; obesity; obesity, obesity.related disorder; therapy. New sialoadhesin family 4 polypetides and polynucleotides - useful to treat various diseases associated with SAF-4 expression.

Claim 13; Page 31-32; 48pp; English.

This is the nucleotide sequence of an expressed sequence tag (EST) clone that encodes a polypeptide (see AAM81024) which shows close homology and/or structural similarity (e.g. a conservative amino acid difference) to new human similarity (e.g. a conservative amino acid difference) conew human similarity (e.g. a conservative amino acid difference) conew human similarity (e.g. a conservative amino acid difference) collypeptides in transformed host cells using recombinant techniques, are disclosed. SAF-4, its agonists and antagonists, and nucleic acid antagonists, and nucleic acid molecules that enhancement or inhibit taff-4 expression, may be used to treat patients in need of enhancement or inhibit to SAF-4 expression or activity. Conditions that may benefit from such treatment include cancer, inflammation, cerebellar degeneration, Alzehimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, head injury campage and other neurological disorders, septic shock, sepsis, stroke, osteoporosis, osteobarthritis, ischemia reperfusion injury, myocardial inflammation, hypotension, historians, myelodysplastic synder, osteoporosis, osteobarthritis, ischemia reperfusion injury, myocardial inflamentologic abnormalities, aplastic anaemia, male baldness and other haematologic abnormalities, aplastic anaemia, male baldness pattern and bacterial, protozoal, fungal and viral infections related to she hat belypeptide activity. Methods of identifying agonists, says, and the pattern and seases associated with inappropriate SAF-4 activity or anaemia.

This cDNA clone codes for new human stalcadhesin family 4 (SAF-4)
polypeptide (See AAM81023). It can be obtained e.g. from a CDNA library
carived from mRNA in cells of human primary dendritic cells, using
expressed sequence tag analysis. SAP-4 polymocleotides and polypeptides
and methods for producing such polypeptides by recombinant techniques are
and methods for producing such polypeptides by and mucleic acid
molecules that enhance or inhibit SAF-4 expression, may be used to treat
patients in need of enhancement or inhibition of SAF-4 expression or
cativity. Conditions that may benefit from such treatment include cancer,
inflammation, autoimmunity, allergy, acthma, rheumatoid arthits. CNS
inflammation, cerebellar degeneration, Alzheimer's disease, harkinson's
disease, multiple solerosis, amyortophic lateral sclerosis, head injury
damage and other neurological disorders, septics shock, sepsis, stroke,
disease, kidney disease, liver disease, ischemic injury, cardiovascular
disease, kidney disease, liver disease, ischemic injury, wycardial
infartion, hypotension, hypettension, AlDS, myclodysplastic syndromes
and other haematologic abnormalities, aplastic anaemia, male baldness
catern and bacterial, protozoal, fungal and viral infections related to
sactern and bacterial, protozoal, fungal and viral infections related
categonists/inhibitors are also provided, as well as diagnostic assays
for detecting diseases associated with inappropriate SAF-4 activity or 230 121 TGCTCTTTCTCCTACCCCCGACAAGACTGGACAGGGTCTACCCCAGCTTATGGCTACTGG 180 TTCTGGATACGAGTGCAGGAGTCAGTGATGGTGCCGGAGGGCCTGTGCATCTCTGTGCCC 120 septic shock, sepsis, stroke, osteoporosis, osteoarthritis, ischemia reperfusion injury; cardiovascular disease, kidney disease, liver disease, myocardial infarction; hypotension; hypertension, AIDS, myelodysplastic syndrome, aplastic anaemia, baldness, infection; ss. 111 TGCTCTTTCTCCTACCCCCGACAGACTGGACAGGGTCTACCCCCAGCTTATGGCTATGG New sialcadhesin family 4 polypetides and polynucleotides - useful to treat various diseases associated with SAF-4 expression. 0; Gaps multiple sclerosis, amyotrophic lateral sclerosis; head injury; 100.0%; Score 1917; DB 2; Length 3099; 100.0%; Pred.
